

Temporal-resolution saturation of structural dominance, stratified by climate category

Cumulative TS04-anchored pairings (TS12–TS04, TS24–TS04, TS36–TS04, TS48–TS04, TS72–TS04). Each panel filters the paired-pool to one IPCC AR6 climate category. Filled dots: WORLD median. Brackets: spread across 10 R10 regions (thick = p25–p75 of regional medians; thin = full range). Note: stratifying by climate compresses angles for high-ambition categories because their parametric $|x|$ is larger relative to C7-Base; compare patterns within a panel, not bar heights across panels.
