

Signed structural dominance: world median vs regional spread

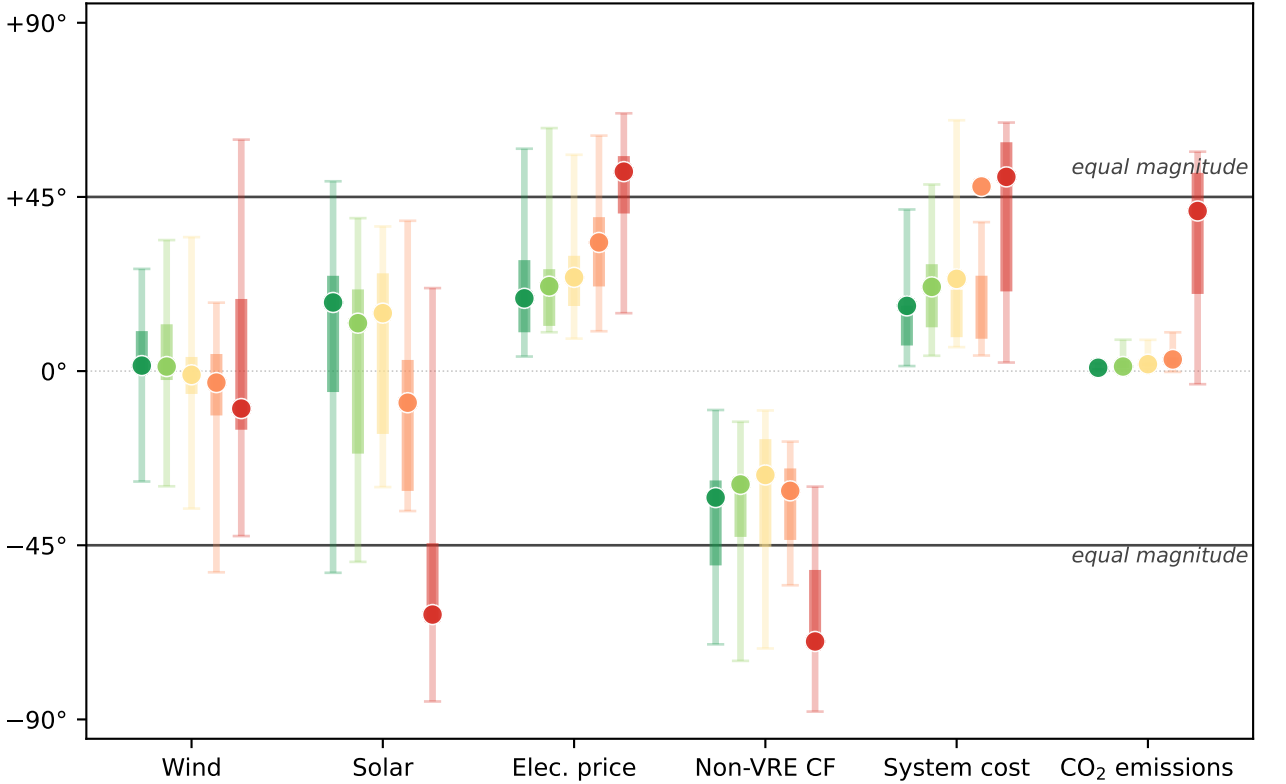

World aggregate values (filled dots) and the spread across the 10 IPCC AR6 R10 regions (brackets: thick = inter-region p25 -p75 of medians; thin = full range). $\theta = \text{atan2}(\text{structural shift}, |\text{parametric shift}|)$; sign shows direction; $|\theta| > 45^\circ$ indicates structural shifts larger than parametric shifts.

Supply-curve detail (LoT→HiT)

- C1 (1.5C, low/no OS)
- C2 (1.5C, high OS)
- C3 (likely 2C)
- C4 (below 2C)
- C7 (above 2.5C)
- World median
- Regional p25-p75 of medians (10 R10 regions)

Temporal resolution (TS04→TS72)

- Regional min-max
- $|\theta| = 45^\circ$
- $\theta = 0^\circ$
